# Python Programming (CST-005) - Unit 1

Unit 1 - Introduction, Syntax & Data Types - notes in easy English, matched to the UTU syllabus.

Study Materials by Anas - study-materials-by-anas.vercel.app

**What this unit covers:** what Python is, how to run it, variables, data types, and basic input/output.

**Key ideas:** Python is **interpreted** (runs line by line), **dynamically typed** (no type declarations - the value decides the type), and uses **indentation** instead of braces. Core types: **int, float, str, bool**, plus the containers list, tuple, set, dict. Variables are names bound to objects; type() tells you the type, type casting (int(), str(), float()) converts. Input comes from input() as a **string** - cast it before arithmetic; output via print() with sep= and end= options. Comments use #, and Python is case-sensitive.

**Exam pointers:** short-answer favourites: "features of Python", "dynamic typing vs static typing", and predicting the output of type-casting snippets (especially input() without int()). Write one tiny program: read two numbers and print their sum, average and the larger one.
